Growify Redesign — Strategy, SEO & Implementation Notes

Prepared as a candidate concept for the Growify Digital LLP AI Generalist practical assignment. This is a strategic prototype based on the supplied assignment brief. Observations about the current site are hypotheses to validate unless explicitly stated as company information from the brief.

1. Executive summary

Reposition Growify as an integrated **growth + commerce + AI + product** company rather than a conventional collection of agency services. The experience connects four capabilities: Commerce & Shopify; Growth, Search & Content; Retention & Engagement; and Data, AI & Operations. The design uses a restrained editorial visual language suitable for premium fashion, luxury, jewellery and lifestyle audiences, with a clear enquiry path on every page.

Proposed value proposition

Growify connects commerce technology, growth marketing and AI-enabled operations to help ambitious brands build better digital customer journeys and make clearer growth decisions.

This is proposed positioning, not a verified existing company tagline. The supplied brief confirms the company works across storefront design, acquisition, conversion, retention, data visibility and operating efficiency.

2. Audit framework and initial hypotheses

The assignment asks candidates to audit messaging, information architecture, navigation, visual design, speed, mobile UX and conversion paths. The following are audit questions and design hypotheses—not claims that the current website definitely has these defects.

3. Competitor and reference research plan

Do not claim a competitor's exact features or performance without verifying its current website. Review these categories and capture screenshots/notes during final research:

1. **Commerce specialists** — study how they explain Shopify, implementation, CRO and platform integrations.
2. **Performance marketing agencies** — study service landing pages, channel detail, reporting language and lead-generation flow.
3. **Premium digital studios** — study visual restraint, editorial storytelling, typography, project presentation and mobile interactions.
4. **AI/product companies** — study how product demos, use cases, capability limits and product/service relationships are explained.

For each reference record: positioning headline, target customer, navigation, proof format, CTA, page speed/mobile issues, useful idea and what Growify should do differently. Inspiration should be adapted, not copied.

4. Target audiences and journeys

- **Founder / business leader:** wants a partner who can connect growth goals to delivery. Journey: Home → capabilities → relevant case study → enquiry.
- **E-commerce / digital lead:** wants better storefront performance or Shopify support. Journey: Home → Services → Commerce & Shopify → relevant proof → enquiry.
- **Marketing lead:** wants acquisition, SEO or retention improvements. Journey: Home → Services → Growth or Retention → measurement approach → enquiry.
- **Operations / analytics lead:** wants reporting clarity and automation. Journey: Home → Data, AI & Operations → workflow examples → enquiry.
- **Innovation / retail lead:** wants virtual try-on or technology exploration. Journey: Home → Products & Technology → Lookify → verified demo/contact.
- **Prospective employee:** wants company context and culture. Journey: About → Careers (future page) → application.

5. Sitemap and priority

The supplied prototype implements the five core informational pages plus Contact. Remaining pages are represented in this architecture plan and should be added after validating priorities and content owners.

6. SEO and AI-search visibility map

Keyword themes below are starting hypotheses; validate search volume, competition and intent with a keyword tool before prioritising.

Technical SEO launch checklist

- Unique title and meta description for each indexable page.
- One descriptive H1 per page; logical H2/H3 structure.
- Semantic landmarks, accessible labels, meaningful link text and keyboard focus.
- Canonical URLs, XML sitemap and robots.txt after final domain/URL decisions.
- 301 redirects from old URLs to relevant new destinations; avoid redirect chains.
- Add Organization and BreadcrumbList structured data only with verified details; use Product/Service schema only where eligible and accurate.
- Compress and size images, use modern formats, provide descriptive alt text, lazy-load below-the-fold images and avoid layout shifts.
- Measure Core Web Vitals, mobile usability, indexing and crawl errors after launch.
- Add internal links between services, industry pages, case studies and products.
- Publish helpful FAQs and explainers with clear authorship, evidence and last-updated dates; do not promise ranking in AI answers.
- Track Google Search Console clicks/impressions/CTR/indexing and analytics landing-page conversions.

7. Case-study pipeline and evidence requirements

Two designed concepts are included in the prototype:

1. **A more considered commerce journey** — UX audit, product discovery, storefront improvements and measurement plan.
2. **Clearer reporting, better decisions** — data-source mapping, shared KPI definitions, dashboard and repeatable workflow.

Both are clearly marked illustrative, with outcomes pending validation. They are not representations of completed client engagements.

Six additional recommended themes:

1. Luxury customer acquisition — spend, attributed revenue, ROAS methodology, campaign window and creative approvals.
2. Shopify redesign and conversion — baseline/post conversion, device mix, AOV, checkout completion and test log.
3. International D2C expansion — market scope, localization, payments, fulfilment, revenue by market and time period.
4. Lifecycle email/WhatsApp — opt-in basis, deliverability, click/conversion rates, revenue attribution and unsubscribe rate.
5. SEO growth — Search Console baseline, non-brand clicks, query groups, landing-page changes and dates.
6. High-AOV attribution or AI workflow / virtual try-on — measurement design, operational baseline, accuracy, adoption, consent and approved qualitative feedback.

For every case study collect: client approval, business context, starting point, objective, scope, timeline, team, method, screenshots, source of metrics, attribution caveats, outcome, quote approval and a relevant CTA.

8. Products and integrations

- **Lookify:** The brief identifies a virtual try-on platform and in-store experience capabilities. Use a verified official URL, product demo, supported use cases and approved screenshots.
- **Rossify and Craftify:** Included as requested, but the brief provides no product details. The prototype marks capabilities and availability as pending confirmation. Collect product owner, target audience, problem, features, deployment, demo, pricing/availability and support details.
- **LimeChat, QuickReply and Razorpay:** Included as integration ecosystem examples. Confirm official names, current technical support, logo permissions and whether each relationship is a product integration or formal commercial partnership before publication.
- **Pagey and Clocal:** Excluded, following the assignment brief.

9. Lead generation and measurement

Recommended events: `primary_cta_click`, `service_cta_click`, `case_study_open`, `product_demo_click`, `contact_form_start`, `contact_form_submit`, `email_click` and `phone_click` (only if a phone option is added). Use consent-aware analytics and avoid sending personally identifiable form values into analytics.

A practical reporting view should include sessions by landing page, engaged sessions, service page progression, CTA clicks, form completion rate, qualified enquiries and source/medium. Define each event and conversion consistently before launch.

Prototype limitation: The included contact form opens a prefilled email draft with `mailto:`; it does not store submissions, send data to a server or connect to a CRM. Replace it with an approved backend/form provider before production.

10. AI workflow and tool disclosure

Suggested workflow for the candidate's final write-up:

1. Use the supplied brief to extract deliverables and evaluation weights.
2. Use an AI assistant to draft information architecture, copy options, SEO themes and implementation scaffolding.
3. Build a static responsive prototype in HTML/CSS/JavaScript and inspect the code in VS Code.
4. Verify navigation, responsive breakpoints, form behaviour and content manually in a browser.
5. Keep assumptions separate from verified company information; mark product and client data gaps.
6. Run a performance/accessibility audit on the deployed preview and record remaining issues.

Only list tools actually used by the candidate. Do not claim that automated tests, live deployment, client interviews or analytics verification were completed unless they were actually performed.

11. Known limitations and next steps

- The prototype is static and is not deployed to a public live URL.
- Detailed competitor research and live performance benchmarking remain to be completed.
- Product and partner claims need owner verification.
- Case studies are concept layouts; real client results are not supplied.
- No office videos were provided, so the optional immersive office tour was not built.
- No backend/CRM integration is included.

Priority next steps: verify content with Growify, conduct competitor research, test on real devices, deploy a preview, capture a walkthrough video, and export this strategy to PDF if required.
